

Utilize the full potential of the SNMP capabilities of the SM-2512 or SM-2503. Failures can occur when link signal is still present and data will not pass (Soft Failure). This can occur when a software application fails in a certain manner. By actively monitoring a ping or other application between server and switch, any MIB 2 compliant network manager can "force switch" the Shore Ethernet Link Protector. Please note that the agent port on the Link Protector now becomes a "mission critical" device
